

Software Development Methodology

Mideast Solutions follows a full Software Development Life Cycle (SDLC) for software development.

Mideast Solutions' standardized and refined software development methodology provides a flexible framework for software development projects that can be used to deliver software on time, in budget and with high quality to meet customer expectations.

This methodology is applied to each software development project from initial inception to successful delivery.

The Development process followed by Mideast Solutions includes the following Life Cycle phases:

1. Initiation
2. Analysis and Planning
3. Software Requirements Specification
4. Software System Design
5. Software Development
6. Testing
7. Delivery
8. Support

Project Management

All projects are managed according to the developed Project Plan. The project progress is tracked using this plan and corrective actions are taken whenever required through Development Life Cycle. Customers are able to monitor the progress of development and testing processes.

The project manager is responsible for:

- Project Plan elaboration with tasks, schedule and major milestones.
- Resources allocation in an effective and efficient manner.
- Project risks early identification for elimination or mitigation of their impact on the project.
- Communication with customer on all matters related to the project.
- Control over project progress according to the schedule and budget forecast set forth in the Project Plan.
